

Originalton Friedenspreisträgerin 2024:

(..) *And the expansion of NATO is one of the few true post-Cold-War foreign-policy success stories. By including some of NATO's old enemies inside its security umbrella, we ensured, at a minimal cost, the political, economic and ideological "Westernization" of an enormous swath of the continent.(..)*

2023

(..)But the path to end this war does not only lead through the battlefield. We need to start thinking not just about *helping Ukraine*, but about *defeating Russia*—or, if you prefer different language, *persuading Russia to leave by any means possible*. If Russia is already fighting America and America's allies on multiple fronts, through political funding, influence campaigns, and its links to other autocracies and terrorist organizations, then the U.S. and Europe need to fight back on multiple fronts too. We should outcompete Russia for the scarce commodities needed to build weapons, block the software updates that they need to run their defense factories, look for ways to sabotage their production facilities.(..)

(..)Some of our money is needed too. Spending it now will produce savings down the line, and not just because we can prevent a catastrophe in Ukraine. By learning how to fight Russia, a sophisticated autocracy with global ambitions, we will be better prepared for later, larger conflicts, if there is ever a broader struggle with China or Iran. More important, by defeating Russia, we might be able to stop those larger conflicts before they begin. The goal in Ukraine should be to end Russia's brutish invasion—and to deter others from launching another one somewhere else.

...

At dinner with friends, and we just toasted Congress, for passing the bill to send weapons and ammunition to Ukraine. Cheers to all - and Slava Ukraini!
